PHASE 3 – DATA MODELING & RELATIONSHIPS

1. Roll-Up Summary Fields

- On **Event_c**:
 - o **Registrations Count** → Counts all child Registrations.
 - o Used for capacity validation and reporting.

2. Validation Rules

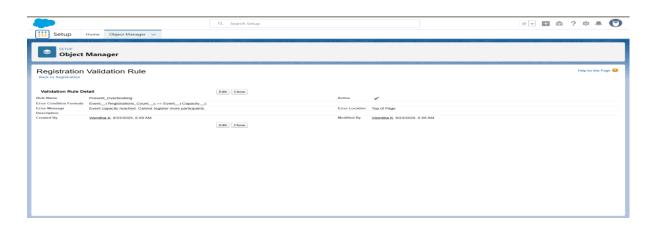

• End Date Validation (Event_c):

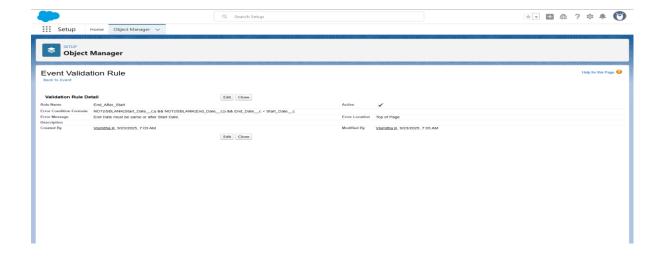

Ensures the event end date cannot be earlier than the start date.

- Prevent Overbooking (Registration_c):
 - Approach 1 Validation Rule:

Simple rule that checks if Registrations_Count__c >= Capacity__c and blocks new registrations.

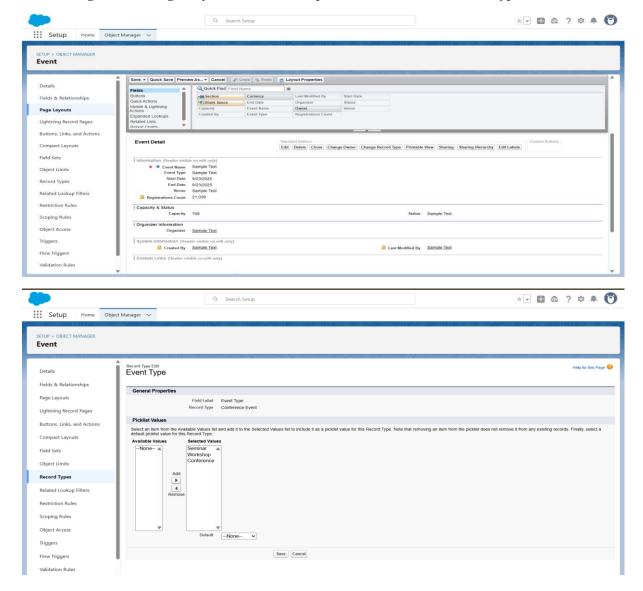

Error: "Event capacity reached. Cannot register more participants."

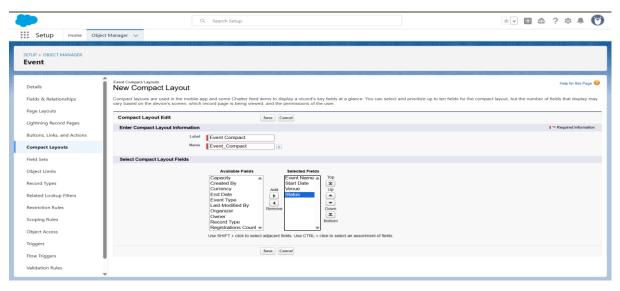

3. Page Layouts & Record Types

- Event Page Layout: shows Event details + related Registrations and record types.
- Registration Page Layout: shows Participant, Event, Status and record types.

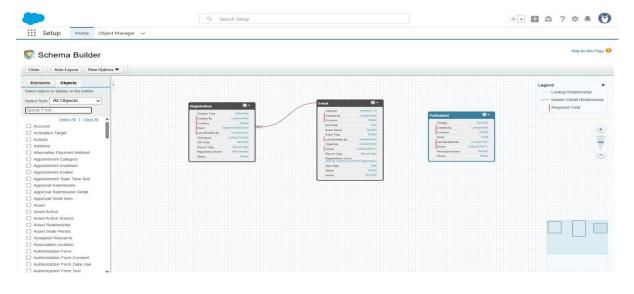

4. Compact Layouts (Mobile)

- Event Compact Layout: Event Name, Start Date, Venue, Status and selected this as primary in edit assignment.
- Registration Compact Layout: Registration ID, Participant, Status.

5. Schema Builder Visualization

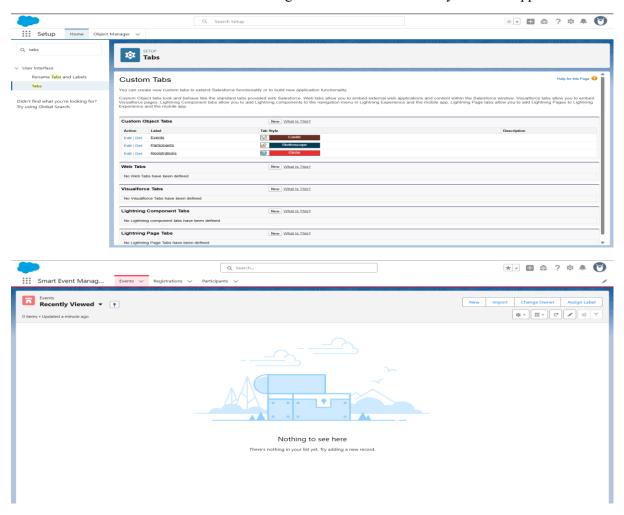

- Created ER diagram of Event–Registration–Participant–Session.
- Ensures clarity of relationships for both admins and developers.

6. Tabs & App Navigation

- Created Custom Tabs for Event, Registration, and Session objects.
- Added them to the **Smart Event Management App** via App Manager.

• This ensures users can access and navigate to these records directly from the App Launcher.

7. Data Dictionary

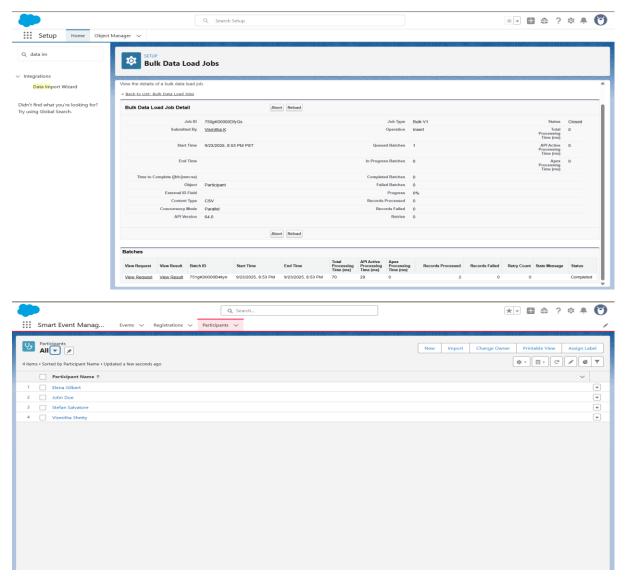

Prepared a data dictionary to clearly describe all custom objects, fields, and relationships:

	Α	В	С	D	E
1	Object	Field Label	API Name	Туре	Notes
2	Event	Event Name	Name	Text	Record Name
3	Event	Start Date	Start_Datec	Date	Event start
4	Event	End Date	End_Datec	Date	Must be after Start Date
5	Event	Venue	Venuec	Text(255)	Location of event
6	Event	Capacity	Capacityc	Number(3,0)	Max participants
7	Event	Registrations Count	Registrations_Countc	Roll-Up (COUNT)	Number of registrations
8	Registration	Registration No.	Name	AutoNumber	REG-{0000}
9	Registration	Event	Eventc	Master-Detail(Event)	Parent event
10	Registration	Participant	Participantc	Lookup(Contact)	Linked participant
11	Registration	Status	Statusc	Picklist	Registered, CheckedIn, Cancelled, Waitlisted
12	Registration	QR Code	QR_Codec	Text(100)	For check-in
13	Registration	Check-in Time	Checkin_Timec	DateTime	Attendance log
14					
15					
16					
17					

8. Sample Data Preparation

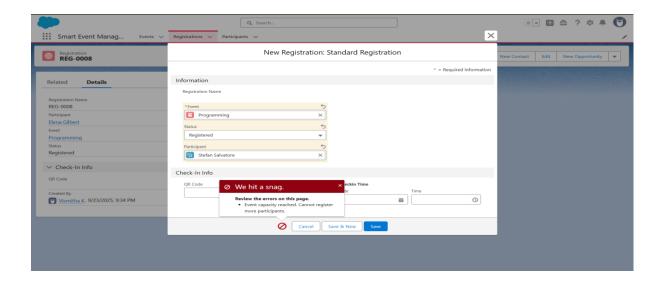

Created sample CSV files to test imports.

Imported using Data Import Wizard to verify data loading.

9. Testing & Verification

- Created an **Event** with capacity = 3.
- Added 3 **Registrations** successfully.
- Attempted 4th registration: blocked by Validation Rule → error shown: "Event capacity reached. Cannot register more participants."
- Tested cancellation of a registration \rightarrow count reduced \rightarrow allowed new registration.
- Verified roll-up summary auto-updates.
- Confirmed End Date validation works (cannot set end date before start date).

OUTCOME OF PHASE 3

- Core Data Model established with Events, Registrations, and Participants.
- Relationships (Master-Detail & Lookup) ensure data integrity and inheritance of visibility.
- Roll-Up Summaries & Validation Rules enforce logical constraints (capacity, date checks).
- Tabs, Layouts, Schema Builder provide usability and visualization.
- Test Data & Import verified that the system works as designed.
- The project is now ready for **Phase 4: Process Automation**, where workflows, approvals, and Flows will be added.
